Features of New High-Strength Steel Materials "550 N/mm² Class" for Building Frames^{CDEsSteect o Mate a s Se ces Ce te}

Abstract:

JFE Steel developed a new line of high-strength steel products with a lower limit tensile strength of 550 N/mm² for building frames using its advanced Super-OLAC (on line accelerated cooling)accelerated cooling technology. This product series currently consists of a steel plate, "HBL385," circular steel tube, "P-385," and square steel tube, "P Column G385." These products realize high strength and excellent earthquake resistance while maintaining the weldability of the conventional steel. The results of a test of members using the square tube confirmed that the cumulative ductility factor of 30, which is required in columns, can be sufficiently secured. A rolled H-shape steel, "HBL-H385," is also under development. A design trial was carried out to it Introduction
